I. Amendments to the Claims

10

15

20

25

30

Please amend the claims as follows with the following version of the claims in accordance with revised 37 CFR § 1.121.

1. (Currently Amended) A method for controlling access to protected resources within a distributed data processing system, the method comprising:

receiving at a first server from a client a request to access a protected resource and a single-use token associated with the client or a user of the client;

validating the single-use token, wherein the single-use token comprises session information for performing session management with respect to the client;

determining that the single-use token is a domain token;

generating a client authorization credential request;

sending to a second server the client authorization

credential request, the single-use domain token associated with

the client or the user of the client, and a single-use domain

token associated with the first server, wherein the first server

and the second server are operated within a common domain;

generating a response to the request; refreshing the single-use token; and

sending the response and the refreshed single-use token to the client.

2. (Currently Amended) The method of claim 1 further comprising:

receiving determining that the single use token is a single-use service token, wherein the single-use a service token is issued by the first server; and

refreshing the single-use service token at the first server.

- 3. (Original) The method of claim 1 wherein the session information in the single-use token is a session key.
- 4. (Canceled).

5. (Currently Amended) The method of claim $\underline{\mathbf{1}}$ 4 further comprising:

validating at the second server the single-use domain token associated with the client or the user of the client and the single-use domain token associated with the first server;

generating the client authorization credential;

5

10

20

25

30

refreshing at the second server the single-use domain token associated with the client or the user of the client and the single-use domain token associated with the first server; and

sending to the first server the client authorization credential, the refreshed single-use domain token associated with the client or the user of the client, and the refreshed single-use domain token associated with the first server.

6. (Original) The method of claim 5 further comprising: storing the client authorization credential at the first server;

generating a single-use service token associated with the client or the user of the client;

and sending to the client the single-use service token along with the response and the single-use domain token.

7. (Original) The method of claim 1 further comprising: receiving a login request from the client at the second server;

challenging the client to provide authentication data; receiving authentication data from the client;

authenticating the client; generating a single-use domain token associated with the client or the user of the client;

generating an authentication response; and

sending the authentication response and the single-use domain token to the client.

8. (Original) The method of claim 7 further comprising:
determining that the login request is a redirected request
from the first server; and

modifying the authentication response to redirect the client to the first server.

9. (Currently Amended) An apparatus for controlling access to protected resources within a distributed data processing system, the apparatus comprising:

means for receiving at a first server from a client a request to access a protected resource and a single-use token associated with the client or a user of the client;

means for validating the single-use token, wherein the single-use token comprises session information for performing session management with respect to the client;

means for determining that the single-use token is a domain token;

means for generating a client authorization credential
request;

means for sending to a second server the client
authorization credential request, the single-use domain token
associated with the client or the user of the client, and a
single-use domain token associated with the first server,
wherein the first server and the second server are operated
within a common domain;

means for generating a response to the request;
means for refreshing the single-use token; and
means for sending the response and the refreshed single-use
token to the client.

10. (Currently Amended) The apparatus of claim 9 further comprising:

5

10

15

20

25

means for <u>receiving determining that the single-use token</u>
is a <u>single-use</u> service token, wherein <u>the single-use</u> a service token is issued by the first server; and

means for refreshing the single-use service token at the first server.

- 11. (Original) The apparatus of claim 9 wherein the session information in the single-use token is a session key.
- 10 12. (Canceled).

5

15

20

25

30

13. (Currently Amended) The apparatus of claim 9 12 further comprising:

means for validating at the second server the single-use domain token associated with the client or the user of the client and the single-use domain token associated with the first server;

means for generating the client authorization credential;
means for refreshing at the second server the single-use
domain token associated with the client or the user of the
client and the single-use domain token associated with the first
server; and

means for sending to the first server the client authorization credential, the refreshed single-use domain token associated with the client or the user of the client, and the refreshed single-use domain token associated with the first server.

14. (Original) The apparatus of claim 13 further comprising:
means for storing the client authorization credential at
the first server;

means for generating a single-use service token associated with the client or the user of the client; and

means for sending to the client the single-use service token along with the response and the single-use domain token.

5

10

15

15. (Original) The apparatus of claim 9 further comprising:
means for receiving a login request from the client at the second server;

means for challenging the client to provide authentication
data;

means for receiving authentication data from the client; means for authenticating the client;

means for generating a single-use domain token associated with the client or the user of the client;

means for generating an authentication response; and means for sending the authentication response and the single-use domain token to the client.

16. (Original) The apparatus of claim 15 further comprising:

means for determining that the login request is a redirected request from the first server; and

means for modifying the authentication response to redirect the client to the first server.

17. (Currently Amended) A computer program product on a computer readable medium for controlling access to protected resources within a distributed data processing system, the computer program product comprising:

5

10

15

20

25

30

instructions for receiving at a first server from a client a request to access a protected resource and a single-use token associated with the client or a user of the client;

instructions for validating the single-use token, wherein the single-use token comprises session information for performing session management with respect to the client;

instructions for determining that the single-use token is a domain token;

instructions for generating a client authorization
credential request;

instructions for sending to a second server the client
authorization credential request, the single-use domain token
associated with the client or the user of the client, and a
single-use domain token associated with the first server,
wherein the first server and the second server are operated
within a common domain;

instructions for generating a response to the request; instructions for refreshing the single-use token; and instructions for sending the response and the refreshed single-use token to the client.

18. (Currently Amended) The computer program product of claim 17 further comprising:

instructions for <u>receiving determining that the single-use</u>

token is a <u>single-use</u> service token, wherein <u>the single-use</u> a

service token is issued by the first server; and

instructions for refreshing the single-use service token at the first server.

- 19. (Original) The computer program product of claim 17 wherein the session information in the single-use token is a session key.
- 5 20. (Canceled).

10

15

20

30

21. (Currently Amended) The computer program product of claim $\frac{17}{20}$ further comprising:

instructions for validating at the second server the single-use domain token associated with the client or the user of the client and the single-use domain token associated with the first server;

instructions for generating the client authorization credential;

instructions for refreshing at the second server the single-use domain token associated with the client or the user of the client and the single-use domain token associated with the first server; and

instructions for sending to the first server the client authorization credential, the refreshed single-use domain token associated with the client or the user of the client, and the refreshed single-use domain token associated with the first server.

25 22. (Original) The computer program product of claim 21 further comprising:

instructions for storing the client authorization credential at the first server; instructions for generating a single-use service token associated with the client or the user of the client; and

instructions for sending to the client the single-use service token along with the response and the single-use domain token.

23. (Original) The computer program product of claim 17 further comprising:

instructions for receiving a login request from the client at the second server;

instructions for challenging the client to provide authentication data;

instructions for receiving authentication data from the client; instructions for authenticating the client;

instructions for generating a single-use domain token associated with the client or the user of the client;

instructions for generating an authentication response; and instructions for sending the authentication response and the single-use domain token to the client.

24. (Original) The computer program product of claim 23 further comprising:

instructions for determining that the login request is a redirected request from the first server; and

instructions for modifying the authentication response to redirect the client to the first server.
